The web application “Google” can be traced back to 1995, when two Stanford University students Larry Paige and Sergey Brin begun working on a search engine called “Backrub”. This application is used to search and explore the internet as we know it today. The application itself can run on about any operating system out there. Google has come a long way and undergone lots of development over the years. Notably in 2004, “Google became the client search engine for one of the Web’s most popular sites, Yahoo!”(Hall and Hosch). This application has proven to be one of the most informative and openly accessible web applications out there. Google provides users with a wide range of possible information and connection to other resources. Google also provides in house services such as google slides and google classroom.

I would definitely recommend Google to another due to its reliability, depth of knowledge, and vast number of capabilities. I’ve used this application throughout my life and have found great success in it. Other web applications don't seem to yield the variety or quality that google provides. For a first-time user Google provides a straightforward and easy route to creating an account or choosing to browse otherwise. A new user doesn't have to create an account but might find it easier to do so as it makes using websites a lot easier sometimes. Below I provided a link to google chrome. This is a simple download and use application that requires zero extra set up once downloaded.as mentioned prior an account can be created but is not necessary for the application to function as normal.
